

Installing Google Chrome Hide 'n' Seek

Considering that you're reading this document right now, it's safe to assume you know that this game is NOT on the Google Web Store. But that leads to one question: if it's not on the Web Store, how do you install it? Well, this wonderful PDF tries to explain that to you!

IP and Port

Before you install the extension, you should know the **PORT** and **IP ADDRESS** of the server. These two values are **REQUIRED** for playing the game and they aren't constant (*they can change*).

Non-Chrome Warning

This game was designed with Google Chrome in mind, and that's it. While browsers like Edge and Opera may work with this, the game was never tested with anything other than Chrome.

On top of that, these instructions also only apply to Chrome. It'll probably be a similar process on other browsers, but...

Knowing Security & Permissions

Google Chrome Hide 'n' Seek has access to a lot of things. According to the Extensions Menu:

Permissions

- Read and change all your data on all websites
- Read and change your browsing history on all your signed-in devices
- Display notifications
- Know your email address

Figure 1 - Used permissions

This is why you **SHOULD DISABLE OR DELETE** the extension after you play it. You can keep the .zip around, just please don't leave the extension active...

Going to Extensions and Enabling Dev Mode

You must go to the Extension settings page. You can either get to this via Chrome Settings, or (my personal favorite) going to the URL `chrome://extensions/`. It should look something like the following:

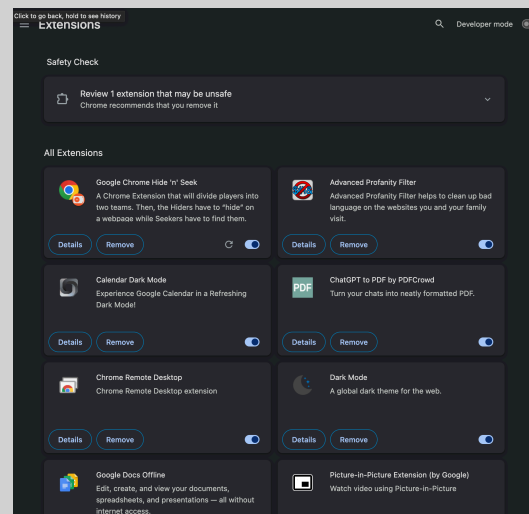

Figure 2 - Example of Chrome Extensions page

Once there, go to the very top right, and enable **DEVELOPER MODE**.

Installing

Now that you have Dev mode, you should see a "Load Unpacked." Simply click that and select the folder containing CGHNS. You can now go into the **DETAILS** to be able to pin to the toolbar (which, isn't required, but is recommended).
